

Technical consulting Munich – IoT solutions & Development Smart Cluster experts for the digital transformation

Achieve tangible success & new synergies with intelligent connected devices

We transform your devices, systems and buildings into **smart IoT devices and powerful systems**.

- ✓ For more **business agility**
- ✓ **Produktivität**
- ✓ **and cost efficiency**

As a **full-service agency for technical consulting from Munich, Germany**, we specialize in agile **software engineering & flexible IoT solutions** that effectively move your business forward.

And that goes far beyond conventional advantages, such as shorter time-to-market or stronger customer loyalty.

With **intelligent, independent and adaptive systems**, we ensure that you **always stay one step ahead**.

bintellix[®] – IoT solutions & IT consulting from a single source

Our IT specialists & software developers always follow a holistic approach that takes your individual needs and options into account.

Our approach can roughly be divided into 3 phases:

1. breaking up rigid isolated applications with adaptive networks & micro-services
2. design & secure high-performance business processes
3. open up and conquer new business areas

The Internet of Things - the basis for sustainable green business

Clean IoT technologies are the **prerequisite** for **sustainability and resource conservation** in the company or in production

Ecological production, environmentally friendly shipping, avoiding waste, using renewable energies - there are plenty of ways and means for **environmentally conscious action**.

But, what matters is the **strategy and the right technology**.

bintellix[®] supports you in creating **economic sustainability in your company** from which you also profit economically. For example through efficient use of resources, low-energy processes and newly formed synergies.

Intelligently thought out instead of out of the box

Future-oriented IoT solutions for your digital business transformation

What do we do?

Our technical consultants **adapt IT landscapes**, design IoT applications and develop micro-services that are **fast, secure and flexible** adapted to current conditions.

The Internet of Things has an **enormous potential for opportunities**. Open standards for systems & applications make it easy for you **to face future challenges with ease**. To achieve **long-term success**.

That is why our approach is adaptive:

We make all processes transparent, scalable & efficient for you.

Always **at eye level, independently** and **at fair prices**.

How do we do that?

Through **smart clusters** made up of lean components (such as microservices) and transparent interfaces (event bus, RESTful APIs). This is how we create an **intelligent network** that is managed via an open repository system (infrastructure repository).

Thanks to the bundling of all individual systems and components involved, a smart system is created - fully automated, performant, scalable & safe.

What do you get out of it?

- ✓ Technology & systems with real-time reaction
- ✓ highest security standards in IT, ITK & IoT
- ✓ steady increase in quality
